

Comments & Logging

- **Comments:**
 - **Comment is a human readable explanation** in the script
 - Adding comments to your Bash scripts will save you a lot of time and effort when you look at your code in the future.
 - Let's say you want to change a script that you wrote a few months or years ago. The chances are that you will not remember why you wrote some complicated piece of code unless you added a comment.
- **# This is single line comment**
- **<< COMMENT**
- **This line won't execute**
- **This line also won't execute**
- **COMMENT**

Comments & Logging

- **Logging:**
 - It is a way to store execution information about your script
 - Adding logging is a good practice
 - **Note:** Add logging for the scripts which you want to execute in the background
