

## Exit Status of a Command

- Each Linux Command return a status(integer value 0-255) when it is executed
- We can capture this return status using `$?`
- If `$?` Value is zero then we can say that executed command was succeeded else failed
- We can also store this exit status of a command (`$?`) into a variable also
  - `cmdStatus=$?` Or `cmdStatus=${?}`
- We use this `$?` Value in conditional statement(if, if else....)
