awk Command

- AWK command is useful to select specific column(s)/field(s) from a given file/text/string or from Command Output based on delimiter(s)
- Note:
  - Default delimiter is space and tab and use –F option for any other delimiters
  - Delimiter could be any number of characters
  - Columns/Field are $1 $2 $3 …..
    - $0 → Entire Row/Line and $NF is last field
    - Number of the record(Line Number) can get using NR
- Syntax:
  - awk '{action}' fileName → To get required field
  - awk –F '[delimiters]' '{action}' fileName
    - Note: action is with print, example: print   or   print requiredField
  - awk '/SearchString/' fileName or awk 'condition' fileName
  - awk '/SearchString/ {action}' fileName   or awk 'condition {action}' fileName

  - CommandOutput | required awk command
